

Trees with Ornamental Berries

Trees with berries are invaluable for attracting wildlife to the garden as well as providing an extra layer of interest for a plant extending the season of interest.

Red berried plants tend to produce their fruits in the autumn and are usually the first of all of the berries to be consumed by birds. Plants that bear berries of other colours tend to fruit earlier in the season with the berries being held for a longer period or until heavy frosts. White-cream and purple-blue/black berries are not as attractive to many birds and as a result are usually left on the plant for a longer period of time unless there is a very harsh winter.

Berries are defined as fruit with a single stone. Fruit are defined as the seed-bearing structure of a plant. Whatever the definition, a tree that provides either is a welcome addition to any garden in the autumn and winter months providing ornamental value, food for wildlife and colour when the garden can be slightly bare.
