

CLOVER TURF v TURF

- 🌿 **Our clover turf is a mix** of amenity turf varieties including ryegrass and a hybrid cross of White clover and Caucasian clover
- 🌿 Clover helps attract bees and other pollinators **aiding biodiversity**. It is environmentally friendly
- 🌿 Lay and treat as you would standard turf. The most critical element is watering for establishment
- 🌿 **Clover turf is more durable** than standard turf. In combination with turf grass, it creates a strong lawn that can be walked on without worry. The clover mix has both rhizomatous and stoloniferous root systems, giving it durability
- 🌿 **Low mow**. Clover turf tolerates less cutting than standard turf, but the more it is mown, the tighter it will be. It needs to be mown especially after flowering, and later in the year before autumn frosts
- 🌿 Clover turf is 100% **plastic free**
- 🌿 **No additional fertilising required**. Clover is a nitrogen fixing plant, absorbing it from the air and transforming it for use by other plants. It does not require a pre turfing fertilizer
- 🌿 **Chemicals are not required**. Clover will choke out other weeds where growth is vigorous. In addition, this helps to reduce attacks by pests i.e. chafer grubs and leather jackets
- 🌿 **Clover will grow in most soil types**, including nitrogen poor soil. It is resilient and nutrient efficient
- 🌿 Clover turf requires **minimal water consumption**, with the exception of establishment
- 🌿 Clover roots penetrate deeply to draw water from a lower level, **making it drought resistant**
- 🌿 Clover turf is more **economical** than turfgrass. Seed is cheaper, less watering is required, less mowing saves on fuel/electricity, fertilisers, and also saves time on aeration and scarification
- 🌿 Clover is **pet friendly**. Dog urine does not affect clover grass in the same way as standard turf, so is better for dealing with unsightly patches
- 🌿 Clover turf will **prevent erosion**. Deep roots help aerate and loosen compacted soil, so there is less water runoff
- 🌿 Clover turf **will** require some maintenance. It will spread into beds and paving unless trimmed back
- 🌿 **Reseeding should not be required**. When mixed with other grasses, clover will re seed itself
- 🌿 **Ideal target** weight is 20kg per roll. However, each roll does **NOT** cover 1m². Measure the area to be covered, and we will calculate the number of rolls to cover your area
